

**Neoprene timing belts**, produced in sophisticated manufacturing processes with state-of-the-art production technology, are made of chloroprene rubber with glass-fiber cords and protective fabric covering on the running surface. Based on the combination of these materials, the timing belts can be used as high-speed and high load-capacity machine drives with constant revolutions. Moreover, they are maintenance-free. Neoprene timing belts are designed for high performance, precise running properties and high operation reliability. They have outstanding mechanical, chemical and physical properties.

**easy drive® Neoprene timing belts** are available in open length and endless sleeves in nearly all lengths and width sizes. The guiding groove on the tooth side is milled subsequently.

**easy drive® timing belts endless (sleeve)** are vulcanized in special molds. These types of belts have very accurate pitch sizes along the entire belt and are particularly suitable for smooth running and high driving speeds.

**easy drive® Neoprene timing belts “M” open length**

Open length timing belts are preferably used in linear applications. They are available with glass-fiber cords or metal cords.
